Journal Audit: Where My Questions Stand

- **Substantially answered (preserve as reference):** Why messy notes trigger negative emotion , how I best serve people in daily life , what drains my energy , and what projects to drop right now, specifically Backyard Baseball and app building .
- **Useful but incomplete answers (need synthesis or stress-testing):** *"What is actually my fear of running out?"* and *"What is my life's work?"* | *"Where do I want to go?"* . I have generated the raw material for both, but stopped one step short of a conclusion.
- **Genuinely unanswered questions:** *"What am I still doing manually because I assume building an alternative would be too expensive or complicated?"* , *"Can I pursue the thing wholeheartedly without making its arrival the condition of my peace?"* , and my one-sentence boundaries for what I refuse to let my life become versus what I am building toward .
- **Insights needing a decision, experiment, or follow-through (not more thinking):** Committing to a specific time and minimal protocol for stand-up mirror practice , signing up for fixed-time social and physical commitments like the workout class after pickleball , and moving forward on the rental house with Zach .

1. What is actually my fear of running out? Is it that success is not sustainable? Okay, so what then? (My wording, combined from pg. 12)

Evidence from my journal

- *"It's not necessarily that Adderall is the problem in and of itself, but feeling like I'm unsustainable and going to run out early every month is like the only roadblock between me and setting up the positive framing within my brain to be able to do anything."*
- *"As a family man, as someone successful in business or in faith, as a disciple, there's a fear of being a hypocrite. There's a fear of my actions not being consistent because I run out of stimulant medication. There's a fear of accountability because of how it impacts my day-to-day movements around said accountability."*

- This is a top priority in my notes because I explicitly name it as the single roadblock to positive framing and listed *"Sit down with my fear of running out and take it all the way to the end"* as an open Next Action .

What I already know / what remains unresolved
I already know that the core issue is not just medication management, but the fear of inconsistency, being judged as a hypocrite, and letting people down once I accept accountability . I also recognize that harsh judgment of hypocrisy makes me avoid putting myself in accountable positions . What remains unresolved is answering my own prompt (*"Is it that success is not sustainable? Okay, so what then?"*, pg. 12) and making an operating decision on how I will function and keep commitments on low-output or unmedicated days.

Why this deserves attention now
Every major goal in my journal requires sustained accountability: stand-up comedy, marriage and fatherhood, leading by example in faith, and living in community . As I interpret how my notes connect, as long as I believe a monthly dip in energy makes me a fraud, I will protect myself by hesitating to go "all in" with a group or schedule firm commitments . Leaving this unresolved keeps me cycling through self-doubt every thirty days.

Best next move
My next move is to complete the reflection I assigned myself on page 2 and page 12: sit down and write out the worst-case scenario of "running out" all the way to the end. I need to pair that reflection with a concrete design step: define a "minimum viable day" protocol for low-energy days so consistency does not require peak stimulant output.

- When I run out or have an off day, what exact obligation am I most afraid of dropping, and who specifically am I afraid will see me drop it?
- What would a "good enough" version of discipline look like on an unmedicated day so I never have to label myself a hypocrite?

Enough clarity to move forward

I have enough clarity when I can state in two sentences what happens if my energy drops mid-project, and I have agreed on one baseline rule for how I show up on low-energy days without abandoning the commitment.

Where do my natural strengths and deep interests overlap to define where I want to go next? (My synthesis of "Where do I want to go?", "What excites me and interests me?", and my Life's Work Questionnaire)

Evidence from my journal

- *"Where do I want to go? #Courage #Hormozi #PodcastNotesForLearning #ActuallyAnswerThis #When - NextTimeIOpenTheNote"* and *"Peep through August 2024: looks like the same shit I'm dealing with now lol, more clutter but where's the progress?!?!"*
- *"Look at my Life's Work Questionnaire answers from Step 1 and Step 2 together. Where they overlap is my direction."*

- This is a priority because I flagged *"Where do I want to go?"* for immediate action at the top of my journal , yet I am treating direction as an unanswered mystery when the pieces are already answered in my questionnaire on pages 13 and 14.

What I already know / what remains unresolved

I have already identified the raw ingredients across my notes:

1. **Unpaid obsession and deep knowledge:** Body alignment, nervous system regulation, and Postural Restoration (PRI) patterns.
2. **Natural edge:** Quick-witted humor, AI systems, lifting, and *"staying sharp inside complexity"* to turn chaos into a next best move.
3. **Core values and exclusions:** Face-to-face service over mass reach, life over work, dropping Backyard Baseball, and ruling out app development as a full focus right now.

What remains unresolved is synthesizing these existing answers into a concrete 90-day direction and choosing the vehicle (such as land work + AI leverage, stand-up/acting, or PRI/body education) that gets my primary focus vs. stays a hobby.

Why this deserves attention now
I noted that "Focus vs. scatter" is a core pattern and that I want to "get serious about something, identify my unique path, and double all of my chips down on it" . Leaving *"Where do I want to go?"* blank at the top of my document creates fake work stress and makes me feel like I have made no progress since August 2024.

Best next move
My next move is to do the exact synthesis task from my Next Actions on page 2: read my completed answers on pages 13 and 14, circle the one answer that makes me feel the most energy, and write three sentences under *"Where do I want to go?"* on page 3 defining my primary focus for the next quarter.

- Looking at my page 8 note (*"Humor | healing | Body | PRI"*), which of these belongs in my career/income bucket, and which belongs purely in personal growth and community service?
- Within my current land work and AI skills , what is the one manual bottleneck I can automate or amplify to buy back time and mental energy for the pursuits that excite me?

Enough clarity to move forward

I do not need a 10-year master plan; I have enough clarity once *"Where do I want to go?"* on page 3 has a written answer that names my #1 professional priority and my #1 personal/creative priority for the next three months, explicitly parking everything else.

3. When will I execute my minimal daily protocol for stand-up and mirror work?

Evidence from my journal

- *"Stand up is what I'm committed to this month... I need to be. For now. At least enough to get up there one time. And build my confidence. Live my life. Do what I said."*
- *"Mirror work through the looking glass ... what's a minimal productive protocol, so that we are actually moving the needle?"* and *"The execution gap. I'm good at defining next steps; the miss is deciding when. Decision and commitment."*
- This is a priority because I have already made the decision to do stand-up this month and identified why I avoid it (*"fear of eyeballs"* and mirror avoidance) making this a pure follow-through test rather than a philosophical question.

What I already know / what remains unresolved

I already know *why* this matters: looking at myself in the mirror while delivering written material with my hands builds self-acceptance and stage readiness . I also know what serious effort looks like to me: *"Working on it as hard as I worked on Barker's speech up until I present on stage. Every day would be unreasonable."* . What remains unresolved is defining the *"minimal productive protocol"* and attaching a specific time of day and an actual open-mic date so the commitment cannot slide.

Why this deserves attention now

I wrote that keeping promises to myself builds the self-belief and identity I want ("Identity is the lever: who I say I am predicts what I do"). As I interpret my notes, because I framed stand-up as a test of "Do what I said" , letting the month pass without getting on stage will reinforce the exact "old patterns" and "loser environment" mindset I moved to Fort Worth to leave behind .

Best next move

My next move is to skip any further journaling on *why* I am afraid of comedy (I already answered that on page 5). My immediate experiment: define my minimal protocol as **5 minutes on a timer in front of the bathroom mirror right after brushing my teeth**, practicing one story out loud while actively using my hands.

- What specific night in the next 14 days has an open mic in Fort Worth where I will put my name on the list?

Enough clarity to move forward

I have enough clarity the moment a 5-minute daily mirror trigger is locked into my routine and a single open-mic date is on my calendar.

Evidence from my journal

- *"Seriously,,, during the day, throughout the week, it's like I don't have anyone to do anything with, but signing up for a class could change that?"* and *"Commit to more responsibility and sign myself up for things... putting myself in positions where I have to show up in the places I need to be at set times, like I did with myofunctional therapy"* .
- *"Where am I aiming to live? I almost feel like I'd rather be in a rental house. With Zach (hopefully), in // around Fort Worth. Next: Pray on it."*
- This is a priority because I repeatedly state "I can NOT become my best self by myself" and trace my energy drain directly to lack of community and "Too much decision making" .

What I already know / what remains unresolved
I already made the call that "Workout class after pickleball: that's the move" (pg. 2, 4, 7) and know that fixed appointment times remove daily friction . I also know I want to live in a rental house with Zach and share my Bible reading for accountability . What remains unresolved is converting these decisions into external commitments that exist outside my head (a booked class, a conversation with Zach, a text to an accountability partner).

Why this deserves attention now
When my weekdays lack built-in social structure, I default to over-optimizing my environment, tweaking notes, and feeling rushed despite having "nothing to do" (pg. 6, 7, 17). Locking in external structure removes daily decision fatigue and naturally surrounds me with people in Fort Worth.

Best next move
My next move is to treat the workout class and the Zach rental house as immediate execution items rather than open reflections . I need to pray on the rental house today as noted on page 3, then text Zach to check his timeline and interest. Simultaneously, I need to book one specific workout class after pickleball for the coming week so I have a set time I must show up for .

- In checking my motive on the housing move (*"Am I moving to be safe, or to be whole?"*, pg. 10), what specific daily rhythm with a roommate would make my life fuller rather than just cheaper or more comfortable?

Enough clarity to move forward

I have enough clarity once I have one recurring weekly class booked on my calendar and a clear yes, no, or timeline from Zach on the rental house.

Start here

I need to address Priority #1 and Priority #2 together at the top of my note in a single 15-minute session:

1. **Minutes 1 to 8 (Clear the Sustainability Block):** I need to open to page 12 (*"What is actually my fear of running out?"*). I need to write four bullet points answering *"Okay, so what then?"*: (1) what actually happens on the day I run out, (2) the worst realistic consequence if someone sees me at 60% capacity, (3) one rule for what counts as a successful "minimum viable day" without

medication, and (4) how I will communicate boundaries so I never feel like a hypocrite.

2. **Minutes 9 to 15 (Answer "Where do I want to go?"):** I need to scroll to pages 13 and 14, circle the one questionnaire answer that sparks the most conviction, and scroll back up to page 3. I need to replace the blank ANSWER → under *"Where do I want to go?"* with three concrete targets for the next 90 days: one for work/income, one for stand-up (including the exact time of day for my 5-minute mirror practice), and one for community/body.

Do not keep re-solving

1. **My relationship with messy notes and digital organization :** I have already diagnosed and solved this. Getting thoughts out of my head is healthy; the trap is "over-setup", hunting for the perfect word while rough drafting, and trying to sequence the entire big picture instead of just the "next couple of steps, next couple of days" (pg. 4, 6, 17). I need to preserve my rule on page 3 and page 6 as final reference: ask *"What specifically do I want from this?"* before opening a note, trust messy drafts, and stop analyzing my note-taking system.
2. **Whether I need mass content or apps to serve God's people :** I keep reopening questions about making apps, YouTube videos, or reaching millions of people, even though I have already settled my conviction . I need to preserve my answer on page 4 and page 12 as settled truth: *"Face to face counts most. Interactions of surprising positivity in daily life move more soul than getting the right message out to a million people"*, app making is not my focus right now , and Backyard Baseball belongs in the archive .

EE Raw Output

My twenty page document is a symptom of the exact problem it diagnoses. I note on page two that looking back at August 2024 reveals the same struggles with more clutter and zero clear progress. Across these twenty pages, I recycle the same unresolved questions through eight separate sections: Next Actions, Answer These Next, Key Insights, Decisions and Commitments, Reflections, Still Developing, Open Questions, and Patterns. I treat note categorization as execution.

Building clarity requires ignoring the fifty minor prompts in this file and resolving the four foundational bottlenecks that generate the rest of my noise.

1. The Vocation and Moat Question: "Where do I want to go?" and "What aspect of my work is hardest to copy?"

I state three times that I need to narrow my focus, identify my unique path, and double all my chips down on it. Yet my attention splinters across land work with Enverus, AI automation, a board game (Girth Who?), Notion templates, YouTube podcast clips, acting, standup comedy, and Postural Restoration Institute (PRI)

body mechanics. I plan to find my direction by comparing Step 1 and Step 2 of my Life's Work Questionnaire to see where they overlap.

- **Key Variables:** Existing cash flow and domain edge in land work, natural talent for AI systems and staying sharp inside complexity, personal fascination with PRI body mechanics and humor, and market compensation.

- **Plausible Options and Tradeoffs:**
  - Option A: Compound my asymmetric advantage in AI driven land work. I combine my ability to turn complexity into action with the one thing my industry ignores (AI). This maximizes income, self belief from recent land project wins, and capital for my family goal, while sacrificing the ego validation of a flashy creator career.
  - Option B: Pursue creative or health products (PRI content, board games, Notion templates, acting, or comedy) as my primary career. This chases novelty and enthusiasm, while trading away my existing industry moat to enter saturated markets where I already admit to avoiding market feedback.
  - Option C: Keep auditioning all seven paths while waiting for questionnaire answers to overlap. This preserves comfort and optionality, while guaranteeing another cycle of scattered energy and stagnation.

- **Strongest Path:** My strongest path is to choose Option A and pair it with my neglected question on page three: "What am I still doing manually because I assume building an alternative would be too expensive or complicated?". I need to build AI workflows inside my land work to dominate peers who only use Enverus. I need to reclassify comedy, pickleball, lifting, and PRI as recreational vitality rather than competing business ventures.

- **Strategic Audit:**
  - **Hidden Assumption:** I assume my "Life's Work" must merge my hobbies (humor, body alignment, games) with my income. I also assume career clarity comes from introspection rather than market leverage.
  - **Missing View:** I already experienced genuine self belief on recent land projects, and I already know my industry ignores AI. I am hunting for a mystery passion while standing on an unexploited goldmine.
  - **Consequences if Wrong:** If I treat every interest as a potential career, I will fragment my deep work capacity and repeat my Notion template failure on a larger scale.
  - **Better Model:** The Barbell Model. I need to allocate my professional focus to my highest leverage economic moat (AI systems in land work) to fund my life and family goals. I need to allocate my personal hours to pure face

to face play and service (standup, pickleball, faith, gym) with zero pressure to monetize them.

- **First Principles Refinement:** Career direction comes from compounding rare, valuable skills where competitors are blind; I need to build my economic engine around AI and complexity in land work, and let my hobbies remain play.

The Biological Reliability Question: "What is actually my fear of running out?"

On page twelve, I identify a foundational blocker: running out of stimulant medication early every month drives a fear of inconsistency, hypocrisy, and accountability. I list the medication as a daily nonnegotiable, yet my planned next action is to sit down, visualize my fears, and pray for abundance.

- **Key Variables:** Daily chemical baseline, dosage governance, nervous system rest states (left side PRI regulation and natural sleep rhythm), and trust in my ability to honor external commitments.

- **Plausible Options and Tradeoffs:**
  - Option A: Treat the fear of running out as a mindset and visualization exercise. This feels comforting and introspective, while leaving a mathematical supply deficit untouched.
  - Option B: Enforce hard physical governance over my supply and baseline recovery. Use an automated timed lockbox or physician dosage adjustment so taking extra pills is impossible, and pair it with strict sleep and parasympathetic recovery protocols. This removes the option to borrow energy from tomorrow, while guaranteeing steady daily capacity.
  - Option C: Eliminate chemical reliance to establish an unmedicated baseline. This removes the supply fear permanently, at the cost of a temporary drop in output while my nervous system recalibrates.

- **Strongest Path:** My strongest path is to execute Option B now. I need to stop treating a logistical supply math error as a spiritual or psychological riddle. I need to lock the daily dose so running out early cannot happen, and use my PRI knowledge and sleep hygiene to regulate my nervous system.

- **Strategic Audit:**
  - **Hidden Assumption:** I assume my brain is irrational for fearing accountability ("my brain is just trying to keep me safe"). My brain is making an accurate prediction: if I burn through a thirty day supply early, my late month self will crash and fail the commitments my early month self made.
  - **Missing View:** Every other goal in my notes (buying into a group, moving into a house with Zach, showing up to set commitments, becoming a

family man) sits downstream of biological predictability.

- **Consequences if Wrong:** If I visualize my fears instead of fixing my dosing protocol, I will stay trapped in boom and bust cycles and continue avoiding deep team commitments.
- **Better Model:** Hardware Over Software. I need to fix the physical constraint (automated dose rationing, electrolytes, sleep window, parasympathetic rest) before attempting mindset work.

- **First Principles Refinement:** Self trust requires predictable biological inputs; I need to engineer an unbreakable daily dosing and recovery boundary so my capacity matches my commitments.

3. The Execution System Question: "How would I live without relying on and slaving to Apple Notes execution?"

I recognize that "over setup" is my trap: making pretty notes, aligning text lines, hunting for the perfect word while rough drafting, and shuffling ideas across AntiNotes to Delete, Bucket Ptitties, Let Crap Go, Anti Notion, and Nooding. Yet my action list prescribes more note archaeology: auditing August 2024 notes and reading three months of Q2 2026 notes. I also note that I define steps well, but fail to decide *when* I will execute them.

- **Key Variables:** Ratio of cataloging to executing, friction between idea capture and calendar scheduling, and cognitive drain from too many inputs and decisions.

- **Plausible Options and Tradeoffs:**
  - Option A: Maintain my multi bucket note architecture while trying to "trust messy notes". This preserves my habit of recording every thought, while burning prime mental energy on digital housekeeping.
  - Option B: Complete my planned historical reviews of August 2024 and Q2 2026 notes. This satisfies completionism, while keeping me anchored in past states instead of present action.
  - Option C: Declare note bankruptcy on my archives and move to a Calendar Only Rule. Archive every existing note bucket without reading it, and require every new action to enter my calendar at a fixed time or get deleted. This sacrifices my digital security blanket to force immediate physical execution.

- **Strongest Path:** My strongest path is to choose Option C. I need to follow my own insight on page nineteen: the present state of my neurons has never existed before, and all it comes down to is this moment. I need to stop reading

old notes from 2024 and Q2 2026. I need to replace todo lists and idea buckets with calendar blocks.

- **Strategic Audit:**
  - **Hidden Assumption:** I assume my past notes contain hidden wisdom I need to excavate before I can move forward.
  - **Missing View:** My note system acts as a counterfeit achievement engine. Formatting insights about "relentless urgency" and "unreasonable volume" gives my brain the dopamine of progress while I sit still.
  - **Consequences if Wrong:** If I keep curating multiple note databases, I will remain overwhelmed by inputs and repeat my page two realization: more clutter with zero progress.
  - **Better Model:** Calendar Forcing Functions. As I proved with myofunctional therapy, I show up when an external commitment has a set time and place. I need to convert "Next Actions" into calendar appointments with real people and delete the rest.
- **First Principles Refinement:** Notes store potential energy, whereas scheduled actions generate kinetic results; I need to kill the note taxonomy and live off my calendar.

4. The Exposure and Community Question: "Am I really committed to stand up?" and "How can I continue surrounding myself with the right people, actually, practically?"

Two major themes converge across my notes: conquering my fear of eyeballs by performing comedy, and ending daytime isolation by surrounding myself with strong community ("I can NOT become my best self by myself"). However, my current plan is to practice comedy alone in front of a mirror every day using my hands before getting on stage once.

- **Key Variables:** Live audience feedback versus solo self surveillance, recurring social forcing functions, and tolerance for public imperfection.

- **Plausible Options and Tradeoffs:**
  - Option A: Grind solo mirror sessions every day until I feel ready for the stage. This shields me from bombing in public, while turning comedy into another solitary perfectionism trap that keeps me isolated in my bathroom.
  - Option B: Book a live open mic slot and lock in fixed group commitments (post pickleball workout class, attending Tom's comedy shows, rental house with Zach, church accountability). This forces immediate vulnerability and social friction, while solving both my stage fear and my isolation at once.
  - Option C: Drop the standup goal and build confidence through everyday social interactions (gym, pickleball, neighbors). This removes guilt around

stage preparation, while leaving my explicit commitment to take the mic unfulfilled.

- **Strongest Path:** My strongest path is to execute Option B. I need to put a specific open mic date on my calendar before I do another mirror session. I need to use Tom's shows, pickleball, the post pickleball workout class, and moving in with Zach as my social infrastructure.

- **Strategic Audit:**
  - **Hidden Assumption:** I assume staring at myself in a mirror builds stage confidence ("If I can't look at myself in the mirror, how on earth can I expect to take the stage"). In truth, staring in a mirror heightens self consciousness, whereas stage performance requires focusing outward on the room.
  - **Missing View:** On page fourteen, I admit my Notion template effort failed because I hid from real feedback. Practicing comedy alone in a mirror is the exact same avoidance pattern wearing a disguise of discipline.
  - **Consequences if Wrong:** If I make solo mirror perfection the prerequisite for getting on stage, I will turn comedy into a chore, stay isolated during the week, and never test my material in reality.
  - **Better Model:** Live Feedback Immersion. Confidence follows public action and community proximity, not solo rehearsal.
- **First Principles Refinement:** I cure the fear of being seen by being seen in real rooms with real people; I need to trade solo mirror rehearsal for booked stage time and scheduled group classes.

Summary Comparison of My Top 4 Leverage Points

1. Primary Direction

- Current Trap in My Notes: Waiting for questionnaire answers to overlap across 7 hobbies.
- **First Principles Fix**: Build my economic moat where I have an edge; keep hobbies as play.
- **Immediate Forcing Function**: Automate 1 manual workflow in land work using AI.

2. Biological Sustainability
   - Current Trap in My Notes: Visualizing fears about running out of medication early.
   - **First Principles Fix**: Engineer physical dosing constraints and parasympathetic recovery.

- **Immediate Forcing Function**: Put medication in a timed lockbox or adjust prescription with doctor.

3. Execution System

- Current Trap in My Notes: Auditing 2024 and Q2 2026 notes across 5 staging buckets.
- **First Principles Fix**: Replace note curation with scheduled calendar blocks.
- **Immediate Forcing Function**: Archive all note buckets and schedule tasks directly on my calendar.

4. Exposure and Community
    - Current Trap in My Notes: Rehearsing alone in a mirror before stepping on stage or joining groups.
    - **First Principles Fix**: Replace solo self surveillance with live social feedback.
    - **Immediate Forcing Function**: Sign up for 1 open mic and 1 recurring workout class

Which of these four forcing functions will I put on my calendar right now before opening my notes again?
